The FISH Handbook for Biological Wastewater Treatment provides all the required information for the user to be able to identify and quantify important microorganisms in activated sludge and biofilms by using fluorescence in situ hybridization (FISH) and epifluorescence microscopy. It has for some years been clear that most microorganisms in biological wastewater systems cannot be reliably identified and quantified by conventional microscopy or by traditional culture-dependent methods

Biological treatment is a “principle” technology for removal of organisms from wastewaters, and its unintended removal of metal ions is a “nonprinciple” mechanism. Among the most effective waste-management procedures is equalization of the waste stream. Equalization can be of two types: flow
