Introduction To Dislocations
Introduction to dislocations Dislocations are crucially important in determining the mechanical behaviour of materials. This teaching and learning package provides an introduction to dislocations and their motion through a crystal. A 'bubble raft' model is used to demonstrate some of the features of dislocations and other lattice defects.

Patellar dislocations most commonly occur in the lateral direction. Medial dislocations, intra-articular and superior dislocations are rare. The vastus medialis obliquus or VMO is the most distal portion of the quadriceps muscle and exerts a medially directed force that helps keep the patella in position.

Dislocations are defects in the crystal structure of important engineering materials, such as metals, ceramics and semi-conductors, that strongly influence the properties of these materials. Research on dislocations was intense when the first edition of this classic work was published in the 1960s.
