Electric Machinery Synchronous generators convert mechanical energy to electrical energy. Large scale generators are used in Power plants that could generator electrical power in the range of hundreds of Mega Watts. Such generators work based on the principle of magnetic induction known as the Faraday's law.

A 200-kVA, 480-V, 50-Hz, Y-connected synchronous generator with a rated field current of 5 A was tested, and the following data were taken: a. V_t at the rated I_f was measured to be 540 V. b. I_{sc} at the rated I_f was found to be 300 A. When a de voltage of 10 V was applied to two of the terminals, a current of 25 A was measured.

The synchronous generator failure is usually caused by external causes such as lightning strikes, heavy rain, strong winds, or contamination of insulators. Long-term average short circuit statistics indicate that 70 percent of synchronous generator faults are of line-to-ground type and result from insulator flashover during electrical storms.
