- Permanent-cloud based architectures: Vehicles, that form a vehicular network, access to the cloud data centers (or cloud hosted in the RSUs) through means of communication (mobile and wireless networks, satellite networks). They share information with each other and with the cloud, but they do not share their resources.

The PC5 standard allows a device-to-device (D2D) communication feature. A new vehicular network architecture is developed in this PhD to enable the LTE-based 5G network to support V2X communications, which will enhance road traffic safety and energy efficiency as well as improve the safety of vulnerable road users utilising smart phones.

VANETs were first mentioned and introduced in 2001 under "car-to-car ad-hoc mobile communication and networking" applications, where networks can be formed and information can be relayed among cars. It was shown that vehicle-to-vehicle and vehicle-to-roadside communications architectures will co-exist in VANETs to provide road safety , navigation, and other roadside services.

Vehicular ad hoc network - Wikipedia

Current generation vehicular network is mostly developed using the DSRC and IEEE802.11p standards. For the next generation vehicular networks, the 3GPP based LTE standard is considered as one of the key wireless networking technologies for the V2X communication systems.
